

We apologize to every electrical professional for taking 252 years to prevent your failures

Benjamin Franklin discovered electricity in 1752. This year we launched an easy to use, cost effective electrical inspection technology that detects medium and high voltage equipment problems **before they fail!**

What's your IQ?

The Insulation Quality (IQ) Program allows the electrical service provider to easily record electronic signals of in-service electrical equipment that indicate the condition of the insulation.

This IQ program consists of special sensors and an easy-to-use signal recorder with an internal pc used to store the signal files. The files are then electronically sent to our laboratory for expert analysis and report generation.

Now you can test cables, transformers, switchgear and other medium and high voltage equipment without requiring an outage. Contact IQ Services, if you are ready to prevent your next outage.
